

Texas Commission on Environmental Quality

Construction General Permit (TXR150000)

Section 4.1: Post-Construction Stormwater Management

All commercial developments within the State of Texas must manage post-construction stormwater runoff to mitigate downstream impacts. Facility design must accommodate the 25-year storm event. The minimum required detention volume must be calculated using the following standard equation:

$$\text{Required Volume (cu ft)} = C \times I \times A \times T_c \times 60$$

where C is the runoff coefficient, I is the rainfall intensity in inches per hour, A is the site area in acres, and T_c is the time of concentration in minutes.

Engineers must refer to the state intensity tables provided below to determine the baseline required volume for all site compliance reports.

Table 4.1a: State Design Parameters

Parameter	Value
25-Year Storm Intensity (I)	3.5 inches/hr
Commercial Runoff Coefficient (C), 80% impervious	0.8

Compliance with this state permit is required for all construction sites disturbing one or more acres. This document constitutes the statewide baseline standard for stormwater compliance reporting.
